Eagles as 1 to 2 years.

Eagles as 3 years old.

Eagles Fully Grown.

Eagles as adults.

Eagles on the rise.

Eagles life cycle.

The first stage of its life cycle is the egg. The egg contains a bird embryo and food for the embryo. The shell of the egg protects the embryo while it grows. Once the eagle is hatched from the egg it is a baby bird. This is the second stage of an eagle's life cycle.

A baby eagle lives in its parents nest, Its parents bring it food. When baby eagles hatch they are covered with down feathers. After a few weeks the eagle's wings grow stronger. By now it has adult feathers. It can fly out of its nest and get its own food. It is an adult eagle. later it will reproduce.
